A:Title: The seed lectins of black locust (robinia pseudoacacia) are encoded by two gene A:Accession: S62690
A:Status: nucleic acid sequence not shown
A:Molecule type: mRNA
A:Residues: 1-285 < VAN>
A:Cross_references: EMBL:U24249

                                                                                                                                                  *A lectin and a lectin-related protein are the two most prominent proteins in the bark of yellow wood (Cladrastis lutea)."; plant Mol. Biol. 29:579-598(1995)."; Plant Mol. Biol. 29:579-598(1995)."; FUNCTION: MANNOSE/GLUCOSE BINDING BARK LECTIN.
-! FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INTERTBRATES OR HERBIYOROUS HIGHER ANIMALS.
                                                                                                                                                                                                                                                                                                             SUBUNIT: HOMOTETRAMER.
MISCELLANEOUS: BINDS ONE MANGANESE (OR OTHER TRANSITION METAL) ION
AND ONE CALCIDM ION. THE METAL IONS ARE ESSENTIAL FOR THE
SACCHARIDE-BINDING AND CELL-AGGLUTINATING ACTIVITIES (BY

-! FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS.

-! FUNCTION: BARK LECTINS ARE STORAGE PROTEIN THAT PROBABLY MAINTAINS.

STOCKS OF NITROGEN DURING DORMANT PERIOD. SELF-AGGREGATABLE MOLECULES THAT CAN BIND THEIR OWN CARBOHYDRATE SIDE CHAINS. THEY COULD ALSO PLAY A ROLE IN THE PLANT'S DEFENCE AGAINST PHYTOPHAGOUS INVERTEBRATES OR HERBIVOROUS HIGHER ANIMALS.

-! SUBUNIT: RABAI IS COMPOSED OF TWO POLYPEPTIDES, A AND B, THAT ASSOCIATE INTO FIVE DIFFERENT TETRAMERIC ISOLECTINS. THE A4 COMBINATION IS THE ONLY ONE DEVOID OF AGGLUTINATION ACTIVITY.

-! TISSUE SPECIFICITY: MOSTLY IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE INNER BARK IN MOSTLY IN THE AXIAL AND RAY PARENCHYMAL CELLS OF THE XYLEM. STRONG EXPRESSION IN BARK. THE LECTIN ACCUMULATES IN THE XYLEM. STRONG EXPRESSION IN BARK. THE LECTIN ACCUMULATES IN MAY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61 D-SAVLTSFDTIINFEISTPYTSRIADGLAFFIAPPDSVISYH-GGFLGLFPNANTLNNS 118

AND Y HUMAN BLOOD-GROUP DETERMINANTS.

-: SUBUNIT: DIMER OF TWO CHAINS (ALPHA AND BETA) THAT DIFFER ONLY BY THE NUMBER OF OLIGIOSACCHARIDE MOITEIES.

-: MISCELLANEOUS: BINDS ONE MARGANDESE (OR OTHER TRANSITION METAL) ION AND ONE CALCIUM ION. THE METAL IONS ARE ESSENTIAL FOR THE SACCHARIDE-BINDING AND CELL-AGGLOTINATING ACTIVITIES.

-: SIMILARITY: BELONGS TO THE LEGUMINOUS LECTIN FAMILY.

The present sequence represents a peptide of lectin derived propenitor

a cell preservation factor. The protein is used to preserve unipotent,

bluripotent or totipotent progenitor cells, especially haematopoietic

cells, and also progenitors from nerve, muscle, skin, gut, bone,

kidney, liver, pancreas or thymus. Specific applications are

preservation of cultured cells intended for administration after

contemporative therapy (bone marrow or whole-body irradiation

or chemotherapy) to reconstitute the haematopoietic system; enrichment

cof progenitor cells (e.g. during ex vivo purging of malignant cells);

cof progenitor cells (in gene therapy of various

cransplant to improve haematopoietic competence; improving transfer of

exogenous DNA to progenitor cells (in gene therapy of various

capainst ablative therapy (to aliminate proliferating cells specifically),

collowed by re-establishment of differentiation and proliferation of

preserved progenitors. The protein, when linked to magnetic beads, may

see also be used to to isolate cells that express the FLK2/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present sequence is derived from a FRIL (FIK2/FIt3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating population of progenitor cells, hemangloblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell.
                                                                                                                                                                                                                                                                                                                                       a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Lectin derived progenitor cell preservation factor; progenitor cell; haematopoietic cell; cultured cell preservation; anticancer therapy; myeloablative therapy; sickle-cell anaemia; ablative therapy protection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                    q
                                             preservation factor. The protein is used to preserve unipotent, preservation factor. The protein is used to preserve unipotent, preservation factor. The protein is used to preserve unipotent, pluripotent or totipotent progenitor cells, especially hematopoietic cells, and also progenitors cells, intended for administration after preservation of cultured cells intended for administration after cemeritarion enterpy (bone marrow or whole-body irradiation or chemotherapy) to reconstitute the hematopoietic system; enrichment of tissues containing haematopoietic progenitors for subsequent creatment of tissues containing haematopoietic progenitors for subsequent transplant to improve hematopoietic competence; improving transfer of exogenous DNA to progenitor cells (in gene therapy of various capainst ablative therapy (to eliminate proliferating cells specifically), collowed by re-establishment of differentiation and proliferation of preserved progenitors. The protein, when linked to magnetic beads, may also be used to to isolate cells that express the FLKZ/FLT3 receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a FRIL (FIK2/Fit3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell

preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiotherapeutic and/or chemotherapeutic treatment. Including radiotherapeutic compositions to a patient prior to treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment of the patient. FRIL family activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for therapeutic treatment in the patient. FRIL family members are useful for stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutics, so that the patient can receive it is also administered to patients having, or predisposed to developing condition where the patients having, or predisposed to developing depleted, such as severe combined immunodeficiency or aplastic anemia.

The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents fusion protein of alpha-amylase inhibitor signal peptide and FRIL (FIK2/FIL3 tyrosine kinase receptor-interacting lectin). The specification describes a composition of one or more members

of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of a therapeutic treatment, including radiocherapeutic and/or chematopoietic treatment, including a rediocherapeutic and/or chematopoietic treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor cell-depleting activity of the therapeutic treatment in the patient. FRIL family members are useful for isolating propulation of progenitor cells, hemangioblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a FRIL (FIK2/Flt3 tyrosine kinase receptor-interacting lectin) polypeptide. The specification describes a composition of one or more members of FRIL family of progenitor cell preservation factors. The composition is useful for alleviating or reducing the hematopoietic progenitor cell-depleting activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Legume Progenitor cell preservation factors for in vivo or ex vivo preservation of hematopoietic progenitor cells and as therapeutics for alleviating/reducing progenitor cell-depleting activity of cancer
                                                                                                                                                                                                                                       chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are depleted, such as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FRIL; FIK2/Flt3 tyrosine kinase receptor-interacting lectin; progenitor cell preservation factor; radiotherapy; chemotherapy; progenitor cell; hemangioblast; mesenchymal stem cell; cancer; severe combined immunodeficiency; aplastic anemia; tissue repair.

chemotherapeutic treatments. Administration of FRIL compositions to a patient prior to treatments. Administration of FRIL compositions to a patient prior to treatment of the patient with a therapeutic treatment having a hematopoietic progenitor cell-depleting activity alleviates or reduces the hematopoietic progenitor. FRIL family members are useful for isolating population of progenitor cells, hemangloblasts, and mesenchymal stem cells. The composition is administered to reduce progenitor cell depleting effects of chemotherapeutics, so that the patient can receive a higher dose of the chemotherapeutic and preferably recover from cancer. It is also administered to patients having, or predisposed to developing a condition where the patients hematopoietic progenitor cells are a condition as severe combined immunodeficiency or aplastic anemia. The isolated mesenchymal cells are useful for tissue repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                           þe
                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents a Helicobacter pylori GHPO protein of the invention. The polypeptides can be used for preventing or treating Helicobacter infections, and gastroduodenal diseases associated with these infections, including acute, chronic, and atrophic gastritis, and peptic ulcer diseases, e.g. gastric and duodenal ulcers. They can also be used for the production of antibodies. The products can also be used for detection and diagnosis.
                                                                                                                                            GHPO protein; Helicobacter infection; gastroduodenal disease; gastritis;

Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 97 ORFs are shown. The proteins are variously cell envelope proteins, cytoplasmic proteins, secreted proteins or other cellular proteins. Vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           products for the diagnosis, prevention and treatment of infection by {\rm H}\cdot~{\rm Pylori} and other Helicobacter species

                                                                                                                                                                                                                     AAG32057
                                                                                                                                                                                                                                                   \%
                                                                                                                                            The invention relates to a peptide (I) encoded by an operon (II) of Neisseria meningitidis including virulence genes, or a related molecule draving a 40% sequence similarity at the peptide or nucleotide level in a Gram-negative bacterium, or its functional fragment, for therapeutic or diagnostic use. (I) and (II) are useful in the manufacture of a macdicament for treating or preventing a condition (e.g., meningitis) associated with infection by Neisseria or Gram-negative bacteria. The product is useful for veterinary treatment and in a screening assay for the identification of an antimicrobial drug. The vaccines have prophylactic applications. AMU72911-AAU73014 represent N. meningitidis virulence proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying plant target proteins for herbicidally active compounds, comprising aligning and comparing nucleic acid or amino acid sequences from plant with nucleic acid or amino acid sequences from non-plant
